

REDISTRIBUTION STATISTICS

Enrolment Projections

2006 REDISTRIBUTION OF QUEENSLAND

The statistics in this volume are provided by the Australian Electoral Commission (AEC). They have been prepared for the information of persons or organisations interested in the 2006 redistribution of electoral boundaries for 29 House of Representatives Electoral Divisions in Queensland.

The tables in this volume show the electoral enrolment figures as at 2 December 2005 and the projected enrolment figures at 30 November 2007 (the projection time for equality of enrolments for the purposes of Section 63A of the *Commonwealth Electoral Act 1918*)¹. The figures are given at the following levels:

- Census Collection District (CCD)
- Statistical Local Area (SLA)
- Electoral Division
- State

Following a recommendation by the Joint Standing Committee on Electoral Matters (JSCEM) that the AEC and the Australian Bureau of Statistics (ABS) work together on enrolment projections, the ABS has supplied enrolment projections to the AEC using AEC enrolment data as the base. The ABS used a cohort-component method to project the enrolment of each CCD to 30 November 2007.

Divisional Returning Officers (DROs) were asked to examine the ABS projections in the light of their local knowledge and experience, and to substitute their own projections where appropriate. DROs made use of information supplied by relevant local authority planning and statistical groups, as well as their own resources in undertaking this task. The Australian Electoral Officer for Queensland also reviewed the projections and any changes made by DROs to ensure a consistent approach.

Statistics are given at the CCD level, as this level is the smallest commonly used geographic building block. The CCD figures are aggregated to show the totals for SLAs, which are comprised of a number of CCDs. Being somewhat larger than CCDs, SLAs may be more manageable for those who are interested in less detailed analysis. In most cases, the SLA is equivalent to the Local Government Area (LGA). Totals for each Division and the State are also given.

The type of SLA is denoted by a suffix. This is described in detail in the ABS publication *Australian Standard Geographical Classification (ASGC)*, 2001. Briefly, the SLA types are:

- | | |
|-------|------------------------------|
| (B) | Borough |
| (C) | City |
| (CGC) | Community Government Council |
| (DC) | District Council |

¹ On 2 December 2005, in accordance with Section 63A of the *Commonwealth Electoral Act 1918*, the Australian Electoral Commission determined the projection time for the redistribution of Queensland to be 30 November 2007. This date is the mid point between the expected completion of this current redistribution (end November 2006) and the time when the Electoral Commission believes that the representation entitlement of the State of Queensland is likely to change (November 2008). That Determination was published in Special Gazette S227 on 2 December 2005.

(M)	Municipality
(RC)	Rural City
(S)	Shire
(T)	Town

The statistics shown are broken down according to Electoral Division. Where a CCD or SLA crosses Divisional boundaries, the CCD or SLA concerned will be listed in each Division in which electors are enrolled. Only those electors resident in that Division are included in the figures for such CCDs or SLAs. To calculate the total number of electors shown in a split CCD or SLA, the component parts of the CCD or SLA from each relevant Division must be added together.

Two sets of enrolment statistics are shown. Figures are provided for **2 December 2005**, which is the enrolment at close of business on the day the Australian Electoral Commission directed the commencement of the redistribution, and are the figures used for the Electoral Commissioner's determination of the enrolment quota under Section 65 of the *Commonwealth Electoral Act 1918*. The Table on page iii sets out the enrolment quota information to apply for this redistribution. Projected enrolment at **30 November 2007** is also given.

A Growth (%) is also given. This is the estimated growth rate for the period December 2005 to November 2007. The growth rate shown for each CCD is calculated by subtracting the actual enrolment from the projected enrolment, then dividing by the actual enrolment. The result is expressed as a percentage.

The first page of this volume shows total numbers of CCDs, and the total enrolments and growth rates for each existing Electoral Division in Queensland, as well as a total for the State. The subsequent pages show, for each existing Electoral Division, the name of each SLA in the Division, the identifier number of each CCD in the Division, the two sets of enrolment figures and the growth rates applicable to each CCD and SLA, with totals for the Division.

Maps of existing Electoral Division boundaries are available from the Australian Electoral Officer for Queensland, 7th Floor, 488 Queen Street Brisbane (Telephone 07 3834 3400). Maps of census collection districts can be obtained from the Australian Bureau of Statistics.

DATA – CSV FILE

A CSV file **QLD_CCD.csv** is included as a separate link on the AEC website. This file includes enrolment and projected enrolment for each CCD. The file is sorted by electoral division and contains the following information:

Division Name;SLA Name;CCD Number;Actual Enrolment;Projected Enrolment

If technical difficulties are experienced in accessing this data, please telephone the Federal Redistribution Secretariat in Canberra (02) 6271 4468 or e-mail: qld.redistribution@aec.gov.au

Access to a personal computer with the software program, Electoral Boundary Mapping System (EBMS), which runs within the commercial software program MapInfo, will be made available for interested persons, at the office of the Redistribution Committee for Queensland.

Bookings will be required for half-day sessions and can be made by telephoning (07) 3834 3431 during business hours (9.00 am to 5.00 pm). Some knowledge of the systems will be assumed and only a brief introduction can be offered. Access to this system will be available during the periods allowed for suggestions, comments on suggestions, objections and comments on objections.

Redistribution 2006 – Queensland

Quota Information

In accordance with Section 65 of the *Commonwealth Electoral Act 1918*, the Electoral Commissioner has determined the quota of electors for the purpose of the redistribution of Queensland to be **85,220** which has been calculated as follows:

Number of Members of the House of Representatives to which Queensland is entitled	29
Number of electors enrolled in Queensland at the end of the day on which the redistribution commenced (2 December 2005)	2,471,372
Quota for the State	85,220
Permissible maximum number of electors in a Division (quota + 10%)	93,742
Permissible minimum number of electors in a Division (quota – 10%)	76,698

For the purposes of Section 66(3) of the *Commonwealth Electoral Act 1918*, the following figures will apply:

Number of Members of the House of Representatives to which Queensland is entitled	29
Estimated total number of electors enrolled in Queensland at the Projection time ² (30 November 2007)	2,598,034
Average divisional enrolment at the Projection time	89,587
Maximum number of electors in a division at the Projection time (103.5%)	92,722
Minimum number of electors in a division at the Projection time (96.5%)	86,452

² See footnote on page i for information regarding the projection time.

The Queensland Small Area Population Projections (ABS)

This report outlines the method used for producing population and enrolment projections for all Census Collection Districts (CDs) in Queensland, spanning from June 2004 to November 2007.

Projection Method

The main technique employed for the projections was the cohort-component method, widely accepted as the best way of producing age/sex population projections. It involved applying annual fertility and mortality rates and internal migration and overseas migration by age and sex to the base population to produce a projected population, which then became the base for projecting the next year. This cycle was repeated until the projection horizon was reached.

A four-tiered approach was taken in projecting resident population aged 18 years and over for all Statistical Local Areas (SLAs) and CDs in the Queensland.

1. The Queensland population was projected by age and sex.
2. Brisbane/Balance of Qld populations were projected by age and sex (constrained to 1).
3. The population of all Queensland SLAs was projected by age and sex (constrained to 2).
4. The SLA projections were split into CDs.

Finally, the projections were grouped into persons aged 18 years and over, and aligned with enrolment data to produce projected enrolments.

1. State/Territory Projections

The base population for the Queensland cohort-component projections was revised age/sex Estimated Resident Population (ERP) as at 30 June 2004. Assumptions for the projections were based on both short and long-term trends for each component of population change. These fertility, mortality, overseas migration and interstate migration assumptions were from Series B (the medium scenario) in the latest Population Projections, Australia, 2004-2101 (ABS Cat. No. 3222.0). All States and Territories were in fact independently projected, then constrained to sum to the Australian-level projection.

2. Capital City/Balance of State Projections

As per the State/Territory level, the capital city and balance of state projections were taken from Series B in the Population Projections publication. A revised 30 June 2004 ERP base was used, with assumptions reflecting historically observed region-specific patterns of fertility, mortality, overseas migration and internal migration. The Queensland projections acted as control totals.

3. SLA Projections

The base population for the SLA cohort-component projections was revised 30 June 2004 SLA age/sex ERP. The fertility, mortality and migration assumptions were based on SLA-specific levels observed during the past decade, constrained to the assumed capital city/balance of state levels and trends. The net migration assumptions also included some adjustments to prevent excessive deviation from State Government population projections for Local Government Areas. SLA age/sex migration profiles were derived from 2001 Census data on place of usual residence one year ago.

The ABS regularly collects demographic information down to the SLA level, which means that SLA projections (in contrast to smaller areas) are firmly based on series of known data. At each yearly cycle in this process, the resulting SLA projections were constrained to sum to the capital city/balance of state projections, helping to produce more reliable SLA figures. SLAs with ERP under 500 persons were generally held constant for the projection duration, as assumptions for the accompanying tiny age/sex cells are too unreliable.

4. CD Projections

CD projections were formed using extrapolations from 2001-2004 CD ERP constrained to the SLA projections. CD ERP is derived using 2001 Census CD-to-SLA usual residence population proportions updated for post-censal growth using CD building approvals. This approach allows for sub-SLA differential growth while retaining consistency with the SLA projections. The final process adjusts the CD projections for persons aged 18 and over to reflect projected enrolments as at 30 November 2007 using the November 2005 relationship between each CD's

enrolments and its ERP.

The lack of demographic data collected regularly at CD level makes it necessary to use such a conversion method as outlined above. While the process is quite complex, it should be reiterated that the basic concept of splitting SLAs to CD level cannot be expected to give projections as reliable as those for SLAs. However, as the end product will be aggregates of large numbers of CDs there is a high likelihood that any random errors or inconsistencies will be statistically offset in the aggregation process.

Boundaries

CD boundaries are from the Australian Standard Geographical Classification (ASGC), 2001 Edition (ABS Cat. 1216.0), corresponding to those used for the 2001 Census. SLA boundaries are from a subsequent ASGC version, the 2004 Edition.

Disclaimer

It is important to recognise that the projection results given in this report essentially reflect the assumptions made about future fertility, mortality and migration trends. While these assumptions are formulated on the basis of an objective assessment of historical demographic trends and their likely future dynamics, there can be no certainty that they will be realised.

ABS takes responsibility for the method employed, however in accordance with ABS policy regarding small area population projections, the assumptions used are the final responsibility of the client, and the projections are not official ABS population statistics.

The projections may be referred to as "...projections prepared by the ABS according to assumptions reflecting prevailing trends agreed to by the Australian Electoral Commission...".

No liability will be accepted by the ABS for any damages arising from decisions or actions based upon this population projection consultancy service.

Projection methods for the Queensland, Capital City/Balance of State, Statistical Local Areas (SLAs) and Census Collection Districts (CDs) - more details

The four-tiered approach outlined in Appendix I has been further disaggregated in this accompanying paper. Apart from the births formulae all equations apply to both sexes, so sex has not been denoted. "State" and "state-level" may refer to either State or Territory.

Step 1 - State/Territory/Australia Projections

This involved projecting the Queensland population by age and sex, 2004 - 2008. The cohort component method used can be summarised in the formulae below:

x	-> age
max	-> highest age projected (100+ for state; 85+ for sub-state)
t	-> base year
P	-> population
F	-> fertility rate
f	-> females
B	-> births
Q	-> death probability
OM	-> net overseas migration
IM	-> net interstate (or internal) migration
NM	-> net migration (SLA projections only)

In Step 1 the following refer to interstate migration;
 Step 2 they refer to internal migration;
 Step 3 they refer to overseas + inter-SLA migration.

DEP	-> departures
ARR	-> arrivals
DEPRATE	-> per capita departure rate (donor state or capital city-balance or SLA)
ARRRATE	-> per capita arrival rate (receiving states)

For ages 0 to maximum age - 1:

$$(i) \quad P_{x+1}(t+1) = P_x(t) * [1 - Q_x(t)] + \\ (0.5 * OM_x(t)) * (1 - (0.5 * Q_x(t))) + \\ (0.5 * OM_{x+1}(t)) * (1 - (0.5 * Q_{x+1}(t)))$$

$$(ii) \quad P_{max}(t+1) = P_{max}(t) * [1 - Q_{max}(t)] + \\ P_{max-1}(t) * [1 - Q_{max-1}(t)] + \\ OM_{max}(t) * (1 - (0.5 * Q_{max}(t))) + \\ (0.5 * OM_{max-1}(t)) * (1 - (0.5 * Q_{max-1}(t)))$$

Births were then calculated:

$$(iii) \quad B(t) = 0.5 * [\sum_{49} (F_x(t) * P_{f,x}(t)) + \sum_{49} (F_x(t+1) * P_{f,x}(t+1))]$$

After constraining to projected Australian-level births, these were then used to calculate age 0 in the projected year:

$$(iv) \quad P_0(t+1) = B(t) * (1 - Q_b(t)) + (0.5 * OM_0(t)) * (1 - (0.5 * Q_0(t)))$$

Interstate migration was calculated by applying departure rates to the Queensland population and arrival rates to the population of the remaining States and Territories (to obtain numbers departing other States to reside in the Queensland). These rates were derived from 1991, 1996 and 2001 Census data and were held constant for the duration of the projection.

$$(v) \quad DEP_x(t+1) = P_x(t+1) * DEPRATE_x$$

$$(vi) \quad ARR_x(t+1) = P_x(t+1) \text{ Non-Qld} * ARRRATE_x$$

The resulting total arrivals and departures were then scaled to a predetermined total net interstate migration assumption. Finally, the arrivals and departures by age and sex were scaled to the new arrival and departure totals, then combined to give net age/sex interstate migration.

$$(vii) \quad IM_x(t+1) = ARR_x(t+1) - DEP_x(t+1)$$

Then add the interstate migration:

$$(viii) \quad P_x(t+1) = P_x(t+1) + IM_x(t+1)$$

To achieve coherent interstate migration figures, projections are concurrently run for all States, Territories and Australia. After constraining of State age/sex population sum to the Australian-level (method described in Step 2), year t+1 then became the base for projecting the next year and the cycle was repeated until the final projection year was reached.

Step 2 - Brisbane / Balance of Qld Projections

This employs the cohort component method to project Brisbane Statistical Division and the Balance of Qld. The formulae in Step 1 generally apply to these projections, except that the upper age is 85+, fertility rates are by 5yr age of mother and migration arrival levels are used instead of rates.

For ages 0 to maximum age - 1:

$$(ix) \quad P_{x+1}(t+1) = P_x(t) * [1 - Q_x(t)] + \\ (0.5 * OM_x(t)) * (1 - (0.5 * Q_x(t))) + \\ (0.5 * OM_{x+1}(t)) * (1 - (0.5 * Q_{x+1}(t)))$$

$$(x) \quad P_{max}(t+1) = P_{max}(t) * [1 - Q_{max}(t)] + \\ P_{max-1}(t) * [1 - Q_{max-1}(t)] + \\ OM_{max}(t) * (1 - (0.5 * Q_{max}(t))) + \\ (0.5 * OM_{max-1}(t)) * (1 - (0.5 * Q_{max-1}(t)))$$

Births were then calculated:

$$(xi) \quad B(t) = 0.5 * [\sum_{x=15-19}^{45-49} (F_x(t) * P_{f,x}(t)) + \sum_{x=15-19}^{45-49} (F_x(t+1) * P_{f,x}(t+1))]$$

After constraining to projected State-level births, these were then used to calculate age 0 in the projected year:

$$(xii) \quad P_0(t+1) = B(t) * (1 - Q_b(t)) + (0.5 * OM_0(t)) * (1 - (0.5 * Q_0(t)))$$

Capital city-balance of state migration departures were calculated by applying 2001 Census-derived departure rates to the population:

$$(xiii) \quad DEP_x(t+1) = P_x(t+1) * DEPRATE_x$$

Total capital city-balance of state arrivals were then derived using the pre-set net migration assumptions:

$$(xiv) \quad ARR(t+1) = NM(t+1) - \sum_{x=0}^{x=\max} DEP_x(t+1)$$

- (xv) The assumed age-specific arrival levels were derived from 2001 Census data. Together with departures from (xiii) these were simultaneously constrained (via IPF - see xvii - xix) to:
- (a) Capital city-balance of state arrival and departure totals
 - (b) State age-specific net migration

Then the arrivals and departures were applied to the population projected so far:

$$(xvi) \quad P_x(t+1) = P_x(t+1) + ARR_x(t+1) - DEP_x(t+1)$$

Year t+1 then became the base for projecting the next year and the cycle was repeated until the final projection year was reached. However, before $P_x(t+1)$ became the new base, the projected capital city-balance of state were constrained to sum to the State projection. This involved a final 2-way iterative proportional fitting (IPF) process; the year is t+1:

CC-Bal	->	Capital City or Balance of State <i>region</i>
Qld	->	Queensland
a	->	first region
z	->	last region
r	->	region number

Scale the regional (capital city-balance of state) totals to the State total:

$$(xvii) \quad p^{CC-Bal} = p^{CC-Bal} * (p^{Qld} / \sum_{r=a}^{r=z} p_r^{CC-Bal})$$

For each region scale ages to sum to the new region total:

$$(xviii) \quad P_x^{CC-Bal} = P_x^{CC-Bal} * (p^{CC-Bal} / \sum_{x=0}^{x=\max} P_{xr}^{CC-Bal})$$

For each age, scale both regions to sum to the State total:

$$(xix) \quad P_X^{CC-Bal} = P_X^{CC-Bal} * (P_X^{Qld} / \sum_{r=a}^{r=z} P_{Xr}^{CC-Bal})$$

Stages (xviii) and (xix) were then iterated several times before the resulting matrix was rounded.

Step 3 - Statistical Local Area Projections

This used the cohort component method to project all Queensland SLAs. The formulae in Step 1 generally apply to the SLA projections, except that the upper age is 85+, fertility rates are by 5yr age of mother, migration arrival rates are not used and Net Migration (overseas + inter-SLA) was used instead of overseas and inter-SLA separately.

This slightly simpler approach to migration was warranted as the overseas component is negligible in most SLAs in comparison with inter-SLA migration. Furthermore as an annual historical time-series only exists at the SLA level for *net* migration, any overseas/inter-SLA split can only be approximated using past Census data.

For ages 0 to maximum age - 1:

$$(xx) \quad P_{x+1}(t+1) = P_x(t) * [1 - Q_x(t)]$$

$$(xxi) \quad P_{max}(t+1) = P_{max}(t) * [1 - Q_{max}(t)] + P_{max-1}(t) * [1 - Q_{max-1}(t)]$$

Births were then calculated:

$$(xxii) \quad B(t) = 0.5 * (\sum_{x=15-19}^{45-49} [F_x(t) * P_{f,x}(t)] + \sum_{x=15-19}^{45-49} [F_x(t+1) * P_{f,x}(t+1)])$$

After constraining to projected capital city/balance of state births, these were then used to calculate age 0 in the projected year:

$$(xxiii) \quad P_0(t+1) = B(t) * (1 - Q_b(t))$$

SLA migration departures were calculated by applying 2001 Census-derived departure rates to the population:

$$(xxiv) \quad DEP_x(t+1) = P_x(t+1) * DEPRATE_x$$

Total SLA arrivals were then derived using the pre-set net migration assumptions:

$$(xxv) \quad ARR(t+1) = NM(t+1) - \sum_{x=0}^{x=max} DEP_x(t+1)$$

- (xxvi) The assumed age-specific arrival levels were derived from 2001 Census data. Together with departures from (xxiv) these were simultaneously constrained (via IPF - see xvii - xix) to:
- SLA arrival and departure totals (from the previous 2 steps)
 - capital city/balance of state age-specific net internal migration

Then the arrivals and departures were applied to the population projected so far:

$$(xxvii) \quad P_x(t+1) = P_x(t) + ARR_x(t) - DEP_x(t)$$

After constraining the SLA age/sex populations to sum to the capital city/balance of state projections using iterative proportional fitting (method described in Step 2), year t+1 then became the base for projecting the next year and the cycle was repeated until the projection horizon was reached.

Step 4 - Census Collection District Projections

This involved splitting the completed SLA population projections into Census Collection Districts.

(xxviii) Each CD's ERP aged 18 and over was extrapolated linearly to November 2007, based on June 2001 - June 2004 data.

(xxix) Results were then aligned so they summed to the SLA projections. Two approaches were used for this:

- (a) If extrapolated CDs sum to less than projected SLAs (or both projection & extrapolation falling) then scale all CDs in the SLA prorata.
- (b) If the extrapolation was growing faster than the projection, scale down only the growth CDs according to their share of the growing CDs.

This dual approach improved the results for CDs in SLAs where there was widely divergent CD growth.

Note: CD ERP uses building approval data by dwelling-type to incorporate differential growth of CDs when disaggregating post-censal SLA ERP. This affects total CD growth rather than targetting age/sex population change. By constraining to SLA ERP it indirectly 'ages' individual cohorts but resulting CD ERP will tend to reflect the 2001 Census age/sex profiles more than would actually be the case in subsequent years.

Sometimes more recent building approvals by CD becomes available that has not been included in CD ERP. For CDs showing many new approvals but their extrapolation/projection was not showing growth, extra growth was phased in over the following 3 financial years (to allow for occupancy lags).

Conversion of Australian Bureau of Statistics (ABS) Population Projections to Enrolment Projections

The Australian Bureau of Statistics (ABS) have calculated projections of the population of Australian residents aged 18 years and over for each Census Collection District (CD) starting with a base at 30 June 2004 annually through to 30 June 2008. To allow baseline comparison with latest electoral roll counts, interpolation was used to derive 15 November 2005 population. The 30 November 2007 population projections were also calculated by interpolating between 30 June figures.

For most CDs it was assumed that the proportional relationship between electoral enrolments and resident population aged 18+ will continue. Accordingly, the population projections were converted to enrolment projections as follows:

P2005 = ABS projection of residents aged 18+ at 15 November 2005
P2007 = ABS projection of residents aged 18+ at 30 November 2007
E2005 = Enrolled persons at 15 November 2005
E2007 = Projected enrolled persons at 30 November 2007

$E2007 = (E2005 / P2005) * P2007$

For example, a Census Collection District's figures may be:

P2005 = 471
P2007 = 498
E2005 = 411

$E2007 = (411 / 471) * 498$
= 435

Some CDs with very high growth have low enrolment : population ratios due to lags in occupancy and/or change in enrolment address. These ratios were adjusted upwards as the lags work out over time, adjusting to the degree necessary to maintain the overall State enrolment ratio.

In a minority of CDs where enrolments were greater than the baseline population projection, it was assumed that electoral enrolments will grow by the same amount as the population of Australian residents aged 18+, ie:

$E2007 = E2005 + (P2007 - P2005)$

For example, a Census Collection District's figures may be:

P2005 = 146
P2007 = 228
E2005 = 150

$E2007 = 150 + (228-146)$
= 232

Thereafter the Australian Electoral Commission may amend the enrolment projections for certain CDs based on specific local knowledge of the area.
